

A T H E M[®]

"An unreserved success at the cutting edge of amplifier design. It delivers stunning clarity, excellent dynamics and frankly frightening power in a form factor that is practical and energy efficient."

Richard Stevenson, Hi Fi News UK

1,000 WATTS minimum

■ The Statement M1 is a state-of-the-art monaural amplifier delivers 1,000 watts into 8 ohms and 2,000 watts into 4 ohms or less with THD remaining under 0.1% from 20 Hz to 20 kHz. The Anthem design team conceptualized the M1 almost 10 years ago, illustrating just how much in-house design and engineering went into producing this amplifier. The M1 enjoys all of the attributes of Class A/B amplifiers but through proprietary Anthem technologies, goes far beyond the capabilities of Class A, Class A/B and prior Class D amplifiers in the market.

Anthem has created a world class amplifier at any volume, at any watt. The fact that it has well over 1,000 watts on tap - makes it a breakthrough product.

HIGHLIGHTS

M1

- Accurate reproduction of the full dynamic range of the signal
- Output stage is never allowed to clip
- An exceptionally low noise floor

M1

- Outstanding efficiency of high power with low heat output
- An amp so mechanically silent it will suit even the quietest listening room
- A design that allows multiple units to be stacked with no danger of overheating

The Anthem M1 is not a digital amp!

There are no A/D or D/A converters in the signal path. The amplifier's control system continuously varies the width of the output pulse train in direct relation to the analog input signal. In essence, a side-to-side variation in width is analogous to a signal's more familiar up-and-down amplitude variation, not at all the same as a digital string of 1s and 0s where all pulses have the same width.

"The Anthem design team conceptualized the M1 almost 10 years ago, illustrating just how much in-house design and engineering went into producing this amplifier," said Mark Aling, director of marketing for Anthem. "More than just a slim, technologically advanced monaural, the M1 demonstrates that Class D architecture isn't fundamentally flawed, it merely hasn't been implemented well in the past, mainly because it required such a heavy commitment to R&D. We're fortunate to have the resources necessary to create such a ground-breaking product and strongly believe our customers will appreciate the effort."

SUMMARY

After listening to the Anthem M1 for a month now, we realize this amp asks very little - and delivers so much.

It is a true powerhouse amplifier, without being as large and as hot as a convection oven, and it doesn't require two people to move it.

It sounds balanced and detailed at low to moderate volumes, and shows almost limitless reserve and composure when pushed hard, all the while, running cool as a cucumber and standing no taller than a summer time BL&T sandwich. Add the fact that you have almost unlimited headroom - the net result is - you have an exceptional amp that is very easy to live with.

This is where the Anthem M1 separates itself from the other high power amps currently on the market. The M1 makes few demands and delivers everything you could ask.

This amplifier sets new standards of power output and musicality without the physical demands and annoyances of conventional amplifier designs. And it does it in an exceptional way.

Come and listen to the future of modern amplifiers. It sounds superb! No, the M1 is more than that. It is superb.
